

Linux OS – Lab 8

Task 1: Analyzing Logs

1. List all the contents of the **/var/log** directory.
2. View system messages using **cat /var/log/messages**.
3. Use **tail -f** to monitor real-time logs.
4. Press **CTRL+C** to exit the real-time monitoring session.

Task 2: Scheduling Tasks with Cron

1. Create some text files (e.g., **file{1..3}.txt**), then open the current working directory in the GUI using **xdg-open .** command.
2. Move the text files to the **Trash** using the GUI.
3. Start the **cron** service using **systemctl** if it is not already running.
4. Verify that the **cron** service is running and active via **systemctl**.
5. Open the **crontab** editor.
6. Schedule a job to delete all the files in the **Trash** every minute.
7. Verify the scheduled jobs.
8. Remove the scheduled job.

Task 3: Managing Packages with DNF

1. Search for a package named **htop** using **dnf** package manger.
2. Install **htop** on the system.
3. List all installed packages and verify **htop** is installed.
4. View all the available updates on the system.
5. Remove (or uninstall) **htop** package from the system.
6. Check the system's package history to see the installation and removal logs.

Task 4: Managing Packages with RPM

1. List all installed RPM packages on the system.
2. Find detailed information about the **bash** package.
3. List all files provided by the bash package.
4. Find out which package owns the **/bin/ls** file.
5. Download an RPM package of **nano** (do not install it yet).
6. Manually install the downloaded nano RPM package.
7. Verify that nano is installed using rpm.
8. Remove nano using rpm.
